FitSphere AI: An AI-Powered Virtual Clothing Shopping Platform

FitSphere AI is a web-based marketplace that brings multiple clothing stores together on one platform, allowing customers to browse, compare, and virtually try on clothes from home using Augmented Reality (AR). It aims to save time and improve shopping accessibility for people with disabilities, older adults, and individuals with mobility difficulties.

The system uses AI-based facial emotion analysis to estimate customers' reactions during virtual try-on and improve personalized recommendations based on their preferences, clicks, ratings, and purchase history. It also provides smart size recommendations, virtual outfit matching, and cross-store price comparison.

Additionally, the platform supports group buying, allowing customers to obtain wholesale prices when a predefined number of buyers join an offer. Each store has a dedicated dashboard to manage products, prices, stock, ratings, and offers. The platform may also analyze customer demand to help stores identify popular products and create targeted group-buying offers.

Overall, FitSphere AI combines virtual try-on, AI-powered recommendations, and group buying in a unified multi-store marketplace to make clothing shopping more convenient and help retailers reach more customers.
